Trianz | Projects Work Summary

Over 18 weeks I built and deployed four production systems on Azure, covering AI lead qualification, fund request management, leadership reporting, and GTM lead discovery.

1. Concierto Lead Intelligence

An internal AI tool that helps Trianz sales reps decide which leads are worth their time.

What it does

A rep enters a lead's details and answers six questions about budget, decision-maker, need, scope, timeline, and hyperscaler alignment. The app gives the lead a score out of 18 and a tier (Hot, Qualified, Nurture, or Disqualify). An AI assistant then suggests next steps and drafts an outreach email. Bulk upload lets a team score hundreds of leads at once.

What I built

- The scoring engine and the single-lead form with real-time scoring
- AI-generated analysis, next actions, and outreach emails using Claude
- Bulk upload for CSV and Excel files, with a pipeline summary across all leads
- A shared team history stored in the cloud, with PDF, Excel, and CSV export

Technical implementation

- Frontend in React 18 and TypeScript, built with Vite and designed to work on mobile
- Backend in Node.js 22 and Express, which also serves the frontend from one server
- Scoring runs in the browser as pure functions, so results are consistent and instant
- Claude Haiku 4.5 called in tool-use mode, so responses always come back as structured data
- PostgreSQL 18 on Azure, with JSONB columns for scores, flags, and AI results
- Microsoft sign-in restricted to company accounts, plus rate limiting and security headers

Status

Live in production since 19 June 2026.

2. FR Portal (AWS ISV Fund Request Portal)

A web portal that replaces the spreadsheet-and-email process for AWS co-sell funding requests.

What it does

Sellers submit fund requests through a structured form. The FundingOps team tracks every request on a dashboard, and an automatic sync reads AWS's decisions from the team's Excel tracker. Email alerts go out when a request is submitted or its status changes, and every change is recorded in an audit log.

What I built

- The request form, dashboard, detail pages, and admin panel for user roles
- Excel sync that imported 119 funds, reconciling to the cent with the source workbook
- Role-based access and Microsoft single sign-on with company accounts
- Email notifications for submissions and status changes, with a full audit trail

Technical implementation

- Frontend in React 19, TypeScript, Vite, and Tailwind CSS, hosted on Azure Static Web Apps
- Backend in NestJS and TypeScript, exposing a REST API and running on Azure App Service
- PostgreSQL database accessed through Prisma, with role checks enforced on the server
- Excel sync engine shared by manual upload and a scheduled Azure Function, so both produce identical results
- Columns matched by header name rather than position, so a reordered spreadsheet still reads correctly
- Email through Azure Communication Services, sent in the background so it never blocks a user

Status

Live in production since 10 September 2026, with email alerts live from 17 September.

3. Internal Leadership Dashboard

A single dashboard that brings Finance, Sales, HR, Delivery, and Backlog metrics together for Trianz leadership.

What it does

The dashboard pulls the latest figures from the team's SharePoint files on a weekly schedule or on demand. Each tab shows key numbers, charts, and drill-down views, and an AI summary highlights what needs attention.

What I built

- Six dashboard tabs: Executive, Finance, HR, Delivery, Sales, and Backlog, plus Active Engagements
- Data pipelines that read SharePoint files and turn them into dashboard data
- An AI leadership summary and a Needs Attention panel that flags deals needing action
- Export to PDF and Excel, and a migration urgency view for active deals

Technical implementation

- Frontend in Next.js 14 and React with TypeScript, styled with Tailwind CSS and charted with Recharts
- Data pipelines written in Python 3.11 with pandas and openpyxl, which find columns by label rather than fixed position
- Files pulled from SharePoint through the Microsoft Graph API, with a local fallback for development
- Claude Haiku used for per-deal recommendations, with calls run in parallel to cut processing from about 3 minutes to about 15 seconds
- Scheduled refresh with node-cron, and cached data so pages load quickly
- Migration of the data pipelines to Azure Functions with Blob Storage, to run Python reliably on Azure

Status

Live in production, with data refreshing on a schedule and on demand.

4. GTM Lead Intelligence Agent

An agent that finds potential enterprise buyers in public news and turns them into scored sales leads.

What it does

Each user chooses the regions, industries, and Trianz offerings they care about. The agent searches news sources for buying signals, uses AI to confirm that an article points to a real buyer, and scores each lead as Very Hot, Hot, or Warm. Leads appear on the dashboard, and a digest email summarises each run.

What I built

- Discovery from news sources, with duplicate removal and AI-based lead scoring
- Support for all five Concierto offerings across three regions
- Sign-in with company accounts, with each user's data kept separate
- Automatic scheduled runs, lead explorer, search history, and digest emails

Technical implementation

- Next.js 16 with the App Router, React 19, and TypeScript, styled with Tailwind CSS
- PostgreSQL 16 on Azure, with a migration runner that applies database changes safely in order
- Azure OpenAI GPT-4o analyses each article and returns structured JSON with the score and reasons
- News collected from Google News, PR Newswire, and Business Wire RSS feeds
- Duplicate detection using content hashing and normalised article URLs
- Sign-in through NextAuth with Azure AD, and an in-app scheduler for timed runs

Status

Version 1.0 live from 24 September 2026, with all five offerings live by 1 October.
